

1. Mixed Content Page

This first paragraph is ordinary selectable text stored in the document. It describes a page that mixes two kinds of content, and it must be read from the text layer without any recognition step.

This second paragraph was pasted into the page as a picture. Its words are visible to a reader but absent from the text layer, so the pipeline has to recognize them from the pixels of the rendered page.

This third paragraph is selectable text again. It follows the picture and shows that the routing decision is taken for every region and not once for the whole page.
